

Travel Tales

A PROJECT REPORT

Submitted by

Gameti Arth Siddharajbhai

210170116013

In partial fulfilment for the award of the degree of

BACHELOR OF ENGINEERING

in

Information Technology

Vishwakarma Government Engineering College, Ahmedabad

Gujarat Technological University, Ahmedabad

April, 2025

Vishwakarma Government Engineering College, Ahmedabad

CERTIFICATE

This is to certify that the project report submitted along with the project entitled Travel Tales has been carried out by Gameti Arth under my guidance in partial fulfilment for the degree of Bachelor of Engineering in Information Technology, 8th Semester of Gujarat Technological University, Ahmadabad during the academic year 2024-2025.

Prof. Om P. Mehta

Internal Guide

Prof. Vibha D. Patel

Head of the Department

Company Certificate Attached Here

Vishwakarma Government Engineering College, Ahmedabad

DECLARATION

We hereby declare that the Internship report submitted along with the Project entitled **Travel Tales** submitted in partial fulfilment for the degree of Bachelor of Engineering in Information Technology to Gujarat Technological University, Ahmedabad, is a Bonafide record of original project work carried out by me at Vishwakarma government engineering college under the supervision of Internal Guide Prof. Om P. Mehta and that no part of this report has been directly copied from any students reports or taken from any other source, without providing due reference.

Name of Student

Sign of student

Gameti Arth Siddharajbhai

ACKNOWLEDGEMENT

I would like to express my heartfelt gratitude to everyone who supported me throughout the completion of my mini project, "Travel Tales." First and foremost, I am deeply thankful to my internal guide, Prof. Om P. Mehta, Assistant Professor in the Department of Information Technology at Vishwakarma Government Engineering College, Ahmedabad, for his invaluable guidance, encouragement, and insightful feedback. His expertise and constant support were instrumental in shaping this project and helping me overcome challenges.

I am also grateful to the faculty and staff of the Information Technology Department at Vishwakarma Government Engineering College for providing me with the resources and environment to carry out this project successfully. Additionally, I extend my appreciation to my classmates and friends for their collaboration, suggestions, and moral support during this journey.

Finally, I owe a special thanks to my family for their unwavering encouragement and understanding, which motivated me to put in my best efforts. This project has been a significant learning experience, and I am indebted to all who contributed to its success.

Arth Gameti

210170116013

ABSTRACT

This mini project report details my work on the "Travel Tales" project, a web-based platform developed at Vishwakarma Government Engineering College to share travel stories and assist users in planning trips. As a student of Information Technology, I focused on backend development, creating APIs and managing databases to support the application's functionality. This report outlines the design, implementation, and testing phases of the project, highlighting the challenges faced and solutions applied. The project allowed me to apply theoretical concepts from my coursework to a practical scenario, enhancing my technical skills and understanding of software development.

CHAPTER 1: INTRODUCTION TO PROJECT

1.1 PROJECT SUMMARY

□ Project Description

- o Travel tales is a MERN stack web application that allow user to share their travel experience. User can add, like, search, filter stories based on dates. The app ensure secure Authentication using JWT and other verification methods, providing a seamless and engaging user experience.

□ Technology Stack

- o Frontend: React.js, Tailwind CSS
- Backend: Node.js, Express.js
- o Database: MongoDB
- o Additional Libraries: React toaster, axios , Moment.js (for date and time manipulation)

□ Key Features

- o User Registration and Authentication
- o Users can create accounts with unique usernames and passwords.
- o Authentication is implemented to ensure secure access to the platform.

□ Story Creation

- o Users can create new Story by entering a title, Description, add images and video and selecting a publishing date and time.
- o The ability to format text, add images, and preview the stories before publishing is included.

□ All Stories Viewing

- o User can see other story, Images and Videos.
- o User can like others story.

□ Story Update

- o Other users can browse and view published Stories.
- o User can only modify their own story.

Stories are displayed in a user-friendly format with the title, content, Images, Video, and publishing date.

1.2 PURPOSE

The purpose of Travel Tales is to provide a platform where users can share their travel experiences, connect with others, and discover new destinations. It allows users to add their stories, like and appreciate others' posts, and explore various travel experiences through search and filtering options. The platform ensures a secure and personalized experience with JWT authentication and other verification measures, protecting user data and interactions. Designed with a modern and responsive UI using Tailwind CSS, Travel Tales offers an engaging and seamless experience for travel enthusiasts to document and relive their journeys effortlessly.

1.3 OBJECTIVE

The objectives of the project are:

1. Provide a platform to users to share their travel stories experience.
2. User-friendly Interface: Design an intuitive and easy-to-use interface for creating and managing Stories, ensuring a positive user experience.
3. Secure User Authentication: Implement a robust authentication system to protect user accounts and ensure data security.
4. Efficient Content Management: Create a system for organizing and displaying Stories, making it easy for users to browse and read the content.
5. Encourage User Engagement: Implement features such as like, and sharing to foster interaction and engagement among users.
6. Scalability and Performance: Develop the platform to be scalable and performant, capable of handling a growing number of users and Stories.
7. Documentation and Maintenance: Provide comprehensive documentation for the platform and ensure ongoing maintenance and support to keep it running smoothly.

1.4 SCOPE

The scope of the project includes:

1. Story Creation: Users can create new story by entering a title, content, Images, Videos and selecting a publishing date and time. They can also format text, add images, and preview the story before publishing.
2. Like Feature: Users can Like their stories as well as others stories.
3. Story Viewing: Other users can browse and view published Story. Story are displayed in a user-friendly format with the title, content, image, video, and publishing date.
4. User Registration and Authentication: Users can create accounts with unique usernames and passwords. Authentication is implemented to ensure secure access to the platform.
5. Editing and Deleting Blogs: Users can edit or delete their story but cannot edit others story.

The project does not include:

1. Advanced Content Management: The project does not include features like categorizing Stories.
2. Monetization: There are no features for monetizing Stories, such as ads or paid subscriptions.
3. Real-time Collaboration: The project does not support real-time collaboration on Stories between multiple users.
4. Customization: The project does not include extensive customization options for the Story card layout or design.

The scope is focused on creating a simple and functional blogging platform with basic features for creating, scheduling, and viewing Stories

1.5 TECHNOLOGY AND LITERATURE REVIEW

Technology Review

1. **React.js:** React.js is a popular JavaScript library for building user interfaces. Its component-based architecture makes it easy to create reusable UI elements, making development more efficient. React virtual DOM ensures high performance by minimizing DOM manipulation.
2. **Tailwind CSS:** Tailwind CSS is a utility-first CSS framework that provides a set of pre-built classes to style your components. It offers a highly customizable approach to styling, allowing developers to create unique designs without writing custom CSS.
3. **Node.js:** Node.js is a runtime environment for executing JavaScript code outside the browser. It allows you to build scalable, server-side applications using JavaScript. Node.js uses an event-driven, non-blocking I/O model, making it ideal for building fast and efficient web servers.
4. **Express.js:** Express.js is a framework of node.js to write backend code and REST Api.
5. **bcrypt:** bcrypt is a password-hashing function designed to securely hash passwords. It uses a salt to protect against rainbow table attacks and ensures that each hashed password is unique, even if two users have the same password.
6. **Token Authentication:** Token-based authentication involves issuing a token to users after they authenticate, which they then include in subsequent requests to access protected resources. This approach improves security by avoiding the need to store sensitive information like passwords on the client side.
7. **Multer:** Multer is use to handle image and video uploads by changing their name which removes data overriding.
8. **MongoDB:** MongoDB is a non-relational database to store data.

Literature Review

1. **React.js and Tailwind CSS:** Several studies have highlighted the benefits of using React.js and Tailwind CSS together for building modern, responsive web applications. They offer a streamlined development experience and improved performance compared to traditional CSS frameworks.
2. **Node.js and MySQL:** The combination of Node.js and MySQL has been widely adopted for building backend services for web applications. Studies have shown that this stack offers good performance and scalability for handling large volumes of data and concurrent requests.
3. **bcrypt and Token Authentication:** Research has shown that using bcrypt for password hashing and token-based authentication can significantly improve the security of web applications. bcrypt's salting mechanism helps protect against common security vulnerabilities like rainbow table attacks.

Overall, the technologies chosen for the project are well-suited for building a secure, scalable, and efficient blogging platform.

1.6 PROJECT PLANNING

1.6.1 Project Development Approach and Justification

- The project will follow an agile development approach, specifically the Scrum framework, to ensure flexibility and responsiveness to changing requirements. The development process will be divided

into sprints, each lasting two weeks, during which specific features will be implemented, tested, and reviewed. The project will also utilize continuous integration and deployment (CI/CD) practices to ensure that new features are delivered to users quickly and efficiently.

Justification

The agile approach was chosen for several reasons:

- **Flexibility:** Agile allows for changes to be made to the project scope and requirements based on feedback from stakeholders and users. This ensures that the final product meets the needs of its users.
- **Iterative Development:** By breaking the development process into sprints, the project team can focus on delivering small, incremental improvements, which can lead to a more stable and reliable product.
- **Faster Time to Market:** Agile practices, such as CI/CD, help in delivering new features and updates to users quickly, enabling the project to respond to market demands faster.
- **Stakeholder Engagement:** Agile encourages frequent communication and collaboration with stakeholders, ensuring that their feedback is incorporated into the project's development.
- **Risk Management:** Agile's iterative approach allows for early identification and mitigation of risks, reducing the chances of major project setbacks.
- **Overall,** the agile approach is well-suited for this project as it provides a framework for efficient development, encourages collaboration, and allows for adaptability in response to changing requirements and feedback.

1.6.2 Roles and Responsibility

This project has been assigned to each individual student, with each student being responsible for developing both the frontend and backend components independently.

1.7 PROJECT SCHEDULING

Figure 1.1 Gantt Chart

CHAPTER 2: SYSTEM ANALYSIS

2.1 STUDY OF CURRENT SYSTEM

Project 1: WORDPRESS

Overview: WordPress is a popular content management system (CMS) that allows users to create and publish blogs. It offers a range of features, including customizable themes, plugins for additional functionality, and scheduling options for blog posts.

Strengths:

1. Easy to use interface for creating and publishing blogs.
2. Wide range of themes and plugins available for customization.
3. Built-in scheduling feature for scheduling blog posts.

Weaknesses:

1. Can be complex for beginners to set up and customize.
2. Security vulnerabilities due to its popularity and open-source nature.

Areas for Improvement:

1. Enhance user interface to make it more intuitive and user-friendly.

Conclusion: WordPress serves as a good benchmark for the project, highlighting the importance of user-friendly design and robust security features.

Project 2: Medium

Overview: Medium is a blogging platform that focuses on providing a clean and minimalist writing experience. It offers features such as a responsive editor, social sharing options, and a built-in audience for users to discover and follow blogs.

Strengths:

1. Simple and elegant writing interface.
2. Built-in social sharing features for easy distribution of content.
3. Curated content recommendations for users to discover new blogs.

Weaknesses:

1. Limited customization options for blog design.
2. Monetization options are limited for individual bloggers.

Areas for Improvement:

1. Expand customization options to allow for more personalized blog designs.
2. Introduce more monetization options for bloggers to generate revenue.

Conclusion: Medium's focus on simplicity and content discovery provides valuable insights for the project, emphasizing the importance of a clean and user-friendly interface.

2.2 PROBLEMS AND WEAKNESS OF CURRENT SYSTEM

1. **Lack of Scheduled Publishing:** The current system does not support scheduled publishing, limiting users' ability to plan and schedule their stories posts for future publication.
2. **Limited Customization Options:** The current system offers limited customization options for story layout and design, restricting users' ability to create unique and visually appealing stories.
3. **Security Vulnerabilities:** The current system may have security vulnerabilities, such as lack of protection against brute-force attacks and inadequate password storage mechanisms, which could compromise user data.
4. **Limited User Interaction Features:** The current system may lack features for user interaction, such as commenting, liking, and sharing story posts, which are essential for engaging users and building a community around the platform.
5. **Lack of Analytics:** The current system may not provide analytics features to track and analyse blog performance, such as views, likes, limiting users' ability to measure the impact of their content.
6. **Performance Issues:** The current system may suffer from performance issues, such as slow loading times or downtime, which could affect the user experience and reliability of the platform.

2.3 REQUIREMENTS OF NEW SYSTEM

Functional Requirements:

1. **Scheduled Publishing:** Users should be able to schedule their blog posts for future publishing.
2. **Customization Options:** Users should have a range of customization options for story layout, design, and formatting.
3. **Security Measures:** The system should implement strong security measures, such as encryption and protection against common vulnerabilities.
4. **User Interaction Features:** Users should be able to interact with posts, such as liking, uploading images and video, and filter by dates.
5. **Analytics:** The system should provide analytics features to track and analyse blog performance.
6. **Performance Optimization:** The system should be optimized for performance, with fast loading times and minimal downtime.
7. **Accessibility:** The system should be accessible to users with disabilities, following accessibility standards.
8. **Search Functionality:** The system should provide search functionality for users to find specific blog posts.

Non-Functional Requirements:

1. **User-Friendly Interface:** The system should have a user-friendly interface, with clear navigation and intuitive controls.
2. **Scalability:** The system should be scalable to accommodate a large number of users and blog posts.
3. **Reliability:** The system should be reliable, with minimal downtime and data loss.

4. **Compatibility:** The system should be compatible with a wide range of devices and browsers.
5. **Maintainability:** The system should be easy to maintain and update, with clear documentation and modular code.
6. **Legal and COMPLIANCE:** The system should comply with relevant laws and regulations, such as data protection laws.
7. **Performance:** The system should perform efficiently, even under heavy load, to ensure a smooth user experience.
8. **Security:** The system should be secure, with measures in place to protect user data and prevent unauthorized access.

By incorporating these requirements into the new improved system, we aim to address the weaknesses of the current system and provide users with a more robust and user-friendly blogging platform.

2.4 SYSTEM FEASIBILITY

2.4.1 Does the system contribute to overall objective of the project?

Yes, the new system contributes to the overall objective of the project by addressing the weaknesses of the current system and improving its functionality and usability. Specifically, the new system's features, such as scheduled publishing, customization options, security measures, user interaction features, and analytics, align with the project's objective of creating a platform where users can easily create and publish blogs at specific times, and other users can view the blogs.

By implementing these features, the new system enhances the user experience, provides more flexibility and control to users, improves security, and enables better tracking and analysis of blog performance. Overall, the new system contributes to the project's objective of creating a more robust and user-friendly blogging platform.

2.4.2 Can the system be integrated with other system which are already in place?

Yes, the new system can be designed to be integrated with other systems that are already in place. Integration with existing systems can enhance the functionality and usability of the platform, providing a more seamless experience for users.

For example, the new system can be integrated with social media platforms to allow users to easily share their blog posts on social media. It can also be integrated with analytics tools to provide insights into blog performance and user engagement.

Integration with existing systems will require careful planning and coordination to ensure compatibility and smooth operation. APIs (Application Programming Interfaces) can be used to facilitate communication between the new system and other systems, allowing for data exchange and interoperability.

2.5 FEATURES OF THE NEW SYSTEM

1. **Customization Options:** Users have a range of customization options for story layout, design, and formatting, allowing them to create unique and visually appealing story.
2. **Security Measures:** The system implements strong security measures, such as encryption and protection against common vulnerabilities, to ensure the safety of user data.

3. **User Interaction Features:** Users can interact with posts, such as liking, view image and video, and sharing, to engage with the content and build a community around the platform.
4. **Analytics:** The system provides analytics features to track and analyse blog performance, such as views, likes, and view images and video, allowing users to measure the impact of their content.
5. **Performance Optimization:** The system is optimized for performance, with fast loading times and minimal downtime, to provide a smooth user experience.
6. **Accessibility:** The system is accessible to users with disabilities, following accessibility standards, to ensure that all users can access and use the platform.
7. **Search Functionality:** The system provides search functionality for users to find specific blog posts, making it easier to navigate and discover content.

These features contribute to the overall objective of the project by improving the functionality and usability of the platform, providing users with a more robust and user-friendly stories post experience.

2.5 MAIN MODULES OF PROPOSED SYSTEM

1. User Management Module:

- This module handles user authentication, registration, login, and profile management.
- Users can create, edit, and delete their profiles.
- It also manages user roles and permissions.

2. Story Creation Module:

- Allows users to create new Story posts.
- Supports uploading images, videos media files.
- Includes features including like story and save story.

3. Scheduling Module:

- Enables users to schedule their story posts for publishing at specific dates and times.
- Provides a calendar or date/time picker interface for selecting publication dates.
- Handles time zones to ensure posts are published correctly regardless of the user's location.

4. Content Management Module:

- Manages the storage and retrieval of blog posts and associated media files.
- Supports categorization and tagging of blog posts for easy organization and navigation.
- Provides search functionality to help users find specific posts.

5. Publishing Module:

- Handles the actual publishing process of scheduled story posts.
- Ensures that published posts are displayed correctly on the platform.
- May integrate with social media platforms for automatic sharing of published posts.

6. Analytics Module:

- Tracks and analyses various metrics related to story posts, such as page views, likes, upload.

7. Security Module:

- Includes features like encryption, input validation, and secure session management.

2.6 APPROACH AND JUSTIFICATION

1. User Management Approach:

Approach: Implement a user authentication system using a secure protocol like OAuth or JWT (JSON Web Tokens). Utilize a relational database to store user credentials and profile information.

Justification: This approach ensures that only authorized users can access the platform and their data is securely stored. OAuth and JWT are widely adopted standards for authentication, providing robust security.

2. Story Creation Approach:

Approach: Store the story posts as structured data in a database, along with metadata such as author, publication date, and status (draft or published).

Justification: Storing story posts as structured data enables easy retrieval, editing, and management of content.

3. Content Management Approach:

Approach: Use a non-relational database to store story posts, categories, tags, and media files. Implement a robust querying system to efficiently retrieve and filter content based on user preferences.

Justification: non-relational databases provide flexibility. Organizing content into categories and tags enhances discoverability and navigation for users.

4. Publishing Approach:

Approach: Develop a publishing pipeline that validates and formats story posts before they are published. Integrate with a content delivery network (CDN) to optimize the delivery of media files and improve page load times.

Justification: Validating and formatting story posts ensures consistency and correctness in published content. Leveraging a CDN helps mitigate latency issues and improves the overall user experience by delivering content quickly and reliably.

CHAPTER 3: SYSTEM DESIGN

3.1 SYSTEM DESIGN AND METHODOLOGY

- Systems design is the process of defining the architecture, components, modules, interfaces, and data for a system to satisfy specified requirements.
- The System Design Description report provides summary or detailed information about a system design represented by a model.
- Systems design is therefore the process of defining and developing systems to satisfy specified requirements of the user.

3.2 DATABASE DESIGN

Figure 3.3 E-R Diagram

3.3 ACTIVITY DIAGRAM

Figure 3.4 Activity Diagram

3.4 Usecase diagram

Figure 3.5 Usecase diagram

CHAPTER 4: IMPLEMENTATION

4.1 Implementation platform environment

- **Server:** Node.js with the built-in http module or Express.js will handle HTTP requests. You'll create endpoints for user authentication, blog post management, and serving static files.
- **Database:** MongoDB remains your choice for managing structured data such as user information and story posts.
- **Frontend Framework:** React continues to power your frontend, providing a dynamic and user-friendly interface for your blog publishing platform.
- **Token-Based Authentication:** Implement token-based authentication using JWT. Upon successful login, the server issues a JWT to the client, which is included in subsequent requests for authentication.

4.2 Implementation Process

Environment Setup:

- Install necessary software and tools such as Node.js, MongoDB and development IDE (e.g., Visual Studio Code).
- Create a new project directory and initialize a Git repository for version control.
- Set up authentication and storage of media files.
- Configure environment variables for sensitive information such as database credentials and Firebase configuration.

Backend Development:

- Set up the server using Node.js and the http module or Express.js framework.
- Implement routes and controllers for user authentication, blog post management, scheduling, and other functionalities.
- Integrate token-based authentication using JWT for user authentication.
- Set up MongoDB Compass database tables for storing user data, story posts, and other application data.
- Implement database CRUD operations (Create, Read, Update, Delete) for managing user data and blog posts.

Frontend Development:

- Set up React project using Create React App or similar tools.
- Create components for user authentication, profile management, blog creation, scheduling, and other features.
- Implement form validation and error handling for user input.
- Integrate for authentication and media file storage.
- Implement user interfaces for displaying story posts, categories, tags, and other content.

Integration and Testing:

- Connect frontend and backend components to enable communication between the client and server.
- Test each module and functionality to ensure proper operation and responsiveness.
- Conduct unit tests, integration tests, and end-to-end tests to identify and fix bugs and issues.

4.3 IMPLEMENTATION OUTCOMES

- **Improved User Experience:** Users will find it easier to navigate your platform, create and schedule story posts, and manage their accounts, leading to increased satisfaction and engagement.
- **Efficient Content Management:** With features like scheduled post publishing, categorization, and tagging, users can manage their story content effectively, saving time and effort.
- **Increased User Engagement:** Convenient features such as liking, sharing, and social media integration encourage users to interact with each other's content, fostering a sense of community and engagement.
- **Enhanced Platform Credibility:** A reliable and user-friendly platform builds trust among users, encouraging them to publish their content and engage with other users' posts confidently.
- **Scalability and Performance:** A well-architected backend, efficient database management, and optimized server performance ensure that your platform can handle increased traffic and scale as your user base grows.
- **Consistent Platform Updates:** Regular updates and improvements based on user feedback and industry trends ensure that your platform remains relevant, competitive, and aligned with users' needs and expectations.
- **Monetization Opportunities:** With a feature-rich platform and engaged user base, you can explore monetization options such as advertising, premium subscriptions, sponsored content, or affiliate marketing to generate revenue.
- **Positive Word of Mouth:** Satisfied users are likely to recommend your platform to others, leading to organic growth and increased visibility through word-of-mouth referrals.
- **Long-Term Success:** By focusing on delivering value to users and continuously improving the platform based on user feedback and market trends, you set the foundation for long-term success and sustainability.

Figure 4.11 Delete Story

Figure 4.12 Edit Story

Figure 4.13 Responsive Design

Figure 4.14 Responsive Design

CHAPTER 5: TESTING

5.1 TESTING PLAN

- After the source code has been developed, the programme must be thoroughly tested to find as many flaws as possible before being sent to the User. Our objective is to create a set of test scenarios with a high probability of uncovering flaws. Software testing methodologies give systematic direction for creating tests that exercise the internal logic of software components and exercise the program's inputs and outputs domains to find faults in programme operation, behaviour, and performance.
- A software engineer conducts all tests throughout the early phases of testing. Testing professionals may, however, get engaged as the testing process advances. Errors can and do emerge from reviews and other actions, but they are not adequate. The consumer evaluates the application every time it is run! The customer checks the application every time it is run! As a result, you must run the software before sending it to the customer with the goal of detecting and correcting all faults. Tests must be run methodically, and test cases must be prepared using disciplined approaches, to identify the greatest number of mistakes feasible.

5.2 TEST METHODS

5.2.1 Test Cases

Test Case Id	Test Case Description	Expected Result	Actual Result	Pass/Fail
1	User signs up providing valid username/email and password	User account is successfully created	User account created successfully.	Pass
2	User signs up without providing a username/email or password	App displays error message prompting user to fill in all required fields	Error message displayed as expected.	Pass
3	User logs in with correct username/email and password	User is successfully logged into their account	User logged in successfully.	Pass
4	User logs in with incorrect username/email or password	App displays error message indicating invalid login credentials	Error message displayed as expected.	Pass
5	User navigates to page creation screen after logging in	User is presented with options to input title, body text, attachment,	Page creation screen displayed as expected.	Pass

6	User creates a page with all required details provided	Page is successfully created and saved as a draft	Page created and saved successfully as a draft.	Pass
7	User creates a page with no title provided	App prompts user to input a title for the page before saving	User prompted to input title as expected.	Pass
8	User creates a page with no title provided	Show error minimum one image required.	Show error minimum one image required.	Pass
9	User adds an attachment to the page	Attachment is successfully uploaded and can be downloaded by viewers	Attachment uploaded and accessible for download.	Pass
10	User specifies a custom URL for the page	Page is accessible via the custom URL provided by the user	Page accessible via custom URL as expected.	Pass
11	User chooses to display their name on navbar	User's name is displayed on navbar	User name displayed on navbar.	Pass
12	User can like posts of own as well as another story	User can like all stories.	User can like all stories.	Pass
13	User can Update his story not others.	User can update his story and make changes in story.	User can update his story and make changes in story.	Pass
14	User views the list of created pages	All created pages are listed with columns for title, status, and other details	List of created pages displayed as expected.	Pass
15	User sorts the list of pages by Favourite	Pages are sorted Date vies by title.	Pages are sorted Date vies by title.	Pass
16	User filters the story by date.	Only stories with the selected date are displayed in the list	Pages filtered by status as expected.	Pass
18	User search story by any attribute.	User can search for story using any attribute including title, description, location.	User can search for story using any attribute including title, description, location. today.	Pass

19	Validations of date in filter date functionality	Once start date selected user cannot select previous date as end date and also cannot select future dates.	User cannot select previous date as end date and also cannot select future dates	Pass
20	User attempts to access a page with an invalid URL	App displays error message indicating that the page does not exist or the URL is incorrect	Error message displayed for invalid URL as expected.	Pass

Table 5.1 Test Cases

CHAPTER 6: CONCLUSION AND DISCUSSION

6.1 OVERALL ANALYSIS OF PROJECT

The project revolves around the creation of a Travel tales application, aiming to provide users with a streamlined platform for swiftly creating and publishing stories. Users will begin by signing up with basic information and subsequently logging into their accounts. Once logged in, they can access a screen where they can easily initiate the page creation process. The page creation interface allows users to input essential details such as title, description, location and images/video.

Additionally, users can take actions like saving stories and like another's story, cancelling changes as needed and also delete story. The application also features a listing screen where users can view all created stories, organized by their status with options to sort and filter accordingly.

In terms of business implications, the target audience includes content creators, businesses, and individuals seeking efficient webpage deployment solutions. Potential revenue streams may include subscription plans based on features or page limits. To ensure market competitiveness, it's crucial to differentiate the application through its user-friendly interface, customizable features, and efficient publishing options. Finally, effective marketing strategies will be essential for promoting the application's speed, ease of use, and customization capabilities, leveraging targeted advertising, SEO, and social media channels.

6.2 DATE OF CONTINUOUS EVALUATION (CE-I AND CE-II)

6.3 PROBLEM ENCOUNTERED AND POSSIBLE SOLUTIONS

Developing the Travel Tales application came with several challenges, such as ensuring a smooth user experience, managing large amounts of media content, and implementing interactive features like likes and story views. To overcome these, we focused on key solutions.

First, to make the app fast and responsive, we optimized how images and videos load by using lazy loading and a content delivery network (CDN). This helped reduce loading times and improved the overall experience for users.

Second, since users upload their own stories, keeping their data secure was a priority. We implemented strong authentication, encrypted storage, and proper access controls to protect user content and privacy.

Lastly, making interactive features work in real time, like showing likes instantly, required efficient database updates.

With these solutions, Travel Tales became a seamless and engaging platform where users can easily share and explore travel stories while enjoying a secure and smooth experience.

6.4 SUMMARY OF PROJECT

My Experience Working on *Travel Tales*

Working on *Travel Tales* as my college project has been an incredible learning experience. I deepened my knowledge of React.js, Node.js, and MongoDB, which helped me enhance my skills in full-stack development. One of the most exciting parts was implementing features like story uploads, likes, and a seamless story-view experience, which challenged both my technical and creative thinking.

Collaborating with my peers and mentors provided valuable insights and opportunities to refine my approach to problem-solving. Additionally, this project helped me improve my soft skills such as communication, teamwork, and time management, as I had to balance development, testing, and debugging efficiently. Overall, working on *Travel Tales* has equipped me with both technical expertise and practical experience, which will be beneficial for my career in software development.

About *Travel Tales*

Travel Tales is a dynamic social media platform designed to let users share their travel experiences through stories and interactive posts. From seamless content uploads to engaging features like likes, story views, and user interactions, the platform ensures a smooth and immersive experience. With a strong focus on performance, security, and scalability, *Travel Tales* makes storytelling effortless and enjoyable.

By prioritizing user experience and data security, *Travel Tales* enables travellers to document their journeys while connecting with a like-minded community.

6.5 LIMITATION AND FUTURE ENHANCEMENT

Limitations:

1. **Limited Personalization:** Currently, users have limited options to customize their travel stories beyond text and images. Features like custom themes or filters are not yet available.
2. **No Offline Mode:** The platform requires an active internet connection to upload and view stories, making it inaccessible in areas with poor network coverage.
3. **Basic Notification System:** While users receive updates, there is no advanced push notification system to alert them about interactions like likes or comments in real time.
4. **Limited Search and Discovery:** Finding specific stories or connecting with like-minded travellers is not as seamless as it could be, due to the lack of an advanced search or recommendation engine.
5. **No Direct Messaging:** Users cannot directly communicate with each other within the platform, limiting social interaction and engagement.

Future Enhancements:

1. **Interactive Story Templates:** Introduce customizable templates and layouts to help users create visually appealing travel stories.
2. **Offline Mode:** Allow users to draft stories offline and upload them once they have internet access.
3. **AI-Powered Recommendations:** Implement AI-based suggestions for travel destinations, captions, and hashtags based on user preferences.

4. **Advanced Engagement Features:** Add direct messaging, story reactions, and comment threads to encourage user interaction.
5. **Enhanced Search and Discovery:** Improve the search function with filters for location, hashtags, and user-generated tags to help travellers find relevant stories easily.

User Feedback and Ratings: Implement a feedback and rating system where users can provide feedback on pages created by others, fostering a community-driven approach to quality assurance and improvement.
